²Ex-Student, FOBM, Majan College, Muscat, Oman

ABSTRACT

This research aims to study the trend of the principal Index i.e. MSM-30 Index in Muscat Securities Market, Oman. Some of the technical analysis indicators such as Moving Average Convergence & Divergence (MACD), The Dow Theory, Relative Strength Index and Trade Range Breakout, Runs Test have been applied to study the trend in Muscat Securities Market Index (MSM-30) for the period commencing from June 2001 to May 2011. The MSM-30 Index which is a free float value-weighted index comprising 30 companies are selected on the basis of highest market capitalization, liquidity of the stocks and performance in terms of profitability is chosen for the purpose of this study. The findings of the study are quite interesting where most of the technical indicators were helpful in predicting the market movements. MACD as a technical indicator clearly reveals buy and sell points much in advance with reference to MSM-30 Index movement. The Relative Strength Index also indicated a strong support for buy and sell signals. However the Runs test did not provide a clear signal of market movement. Overall the results indicate a strong support for technical analysis using the past trends and buy and sell signals to outperform the market.

KEYWORDS: Capital Gains, Dow Theory, Dividends, Moving Average Convergence & Divergence, Muscat Securities Market, MSM-30 Index, Relative Strength Index, Runs Test, Support & Resistance Technical Analysis, Trade Range Breakout

INTRODUCTION

A company's present value is predominantly determined on the basis of its future earnings which in turn fluctuates due to many reasons such as economic, social and political environment surrounded by it. Hence any investment decisions depend on both dividends and capital gains. Finally it is the market psychology which plays a vital role in making investment decisions. Market movements can be predicted with technical analysis studying the past trends and volume using charts and other tools to forecast the future which is driven by human emotions and market psychology. Often, the nature of price movements are more likely to be the same during a certain period since the market participants react in the same manner as they did before. The research focuses on importance of using selected technical indicators to study the stock market trend with a special reference to the MSM-30 Index in Oman.

Rationale

The drive for doing this research is due to the strong findings and evidence provided by previous researches on The Dow Jones Index by Brock et.al (1992) and Emerging Markets of Latin America & Asia that technical trading rule does help to predict future price movements (Ratner & Leal, 1998). The researchers are keen to find out as to how far the

Technical Indicators would be helpful in predicting the market movements especially with MSM-30 Index in Oman. This in turn would help the prospective investors' in making investment decisions.

Objectives of the Research

- To examine the trend of MSM-30 Index in Oman with the application of technical indicators.
- To identify the buy & sell signals with the help of technical indicators for the MSM-30 Index for the past 10 years.
- To project the importance of technical analysis as a tool of decision making for stock market investments particularly in Oman.

REVIEW OF LITERATURE

Technical analysis is becoming more popular in the recent past due to its ability to predict future direction of market trend. Technical analysts believe that demand and supply during a particular period can be discovered using charts. This type of analysis has been into existence dating back to the 1800s therefore being regarded as an original way of analysing investments (Nison, 1994). Technical analysis began to be used extensively even before financial statements were disclosed which is used by fundamentalists thereby proving the heritage of technical analysis. This further provides evidence on the superiority of technical analysis over fundamental analysis. For quite a few years technical analysis has been well accepted at Wall Street. Largely all the brokerage firms publish technical reports on stock markets and securities also most of the newsletters and articles are based on technical analysis.

Despite of the criticisms, recent studies have found that it can be an excellent tool in order to predict movements of the share prices. In an interesting study conducted by Sweeney,(1988) on Dow Jones 30 realised some potential of making gains using technical trading rules which is against the study conducted by Fama & Blume, (1966) who claim that the Dow Jones 30 for the late 1950s using technical trading rules and realised no gains. In another study conducted by Brock et.al. (1992) on the Dow Jones Index for the period 1897 to 1986 found similar results to Sweeney. In a study conducted by Abbad et.al.(2014) examined the power of using technical rules to predict the stock market trend in Amman stock exchange and their results indicate that the application of technical tools generates buy and sell signal and that the returns following buy signal were more profitable than the returns following sell signals. However Hesham et.al. (2011) conducted a study comparing the valuation methods used by Kuwaiti investors with that of other investors in the emerging stock markets of the world and found that technical analysis is the commonly used methods for stock predictions particularly during their entry and exit points. The study also revealed that the relevance on using moving average rule which was popular among investors in Kuwait which is in par with their counterparts in the world. In another study conducted by Metghalchi & Gomez (2013) in Irish Stock Exchange to know how technical trading rules predict overall stock price movements and whether investors can take advantage of such movements are of the opinion that it depends on the level of transaction costs the investors face. The researchers used four trading strategies to evaluate the effect of trading costs and risk on the overall performance of popular technical indicators to general index of Irish stock market. Further, in yet another interesting study conducted by Aldin et. al.,(2012) emphasise the importance of using Artificial Neural Networks for predicting stock market variations and evaluate the usage of technical indicators such as moving average convergence and divergence, relative strength indicator etc. in Tehran Stock Exchange and their results indicate that artificial neural networks are dominant tools for stock market prediction. In contrast Azizan et. al.(2011) were

of the opinion that there are two conditions in the market viz., trending and ranging. Often investors are confused with the incorrect entry signals when applied trending algorithm to the ranging market thus resulting in loss. Further the authors suggested to bands of moving average and standard deviation to avoid some these false signals and identify the trend at an early stage. A similar study was conducted in Taiwan with TAIEX to predict the movement of the market especially with derivative options by the author studied the Taiwan Stock Exchange Index using technical analysis in order to predict the trends and use derivative options to make profits. They discovered that moving average rules did help them to make positive returns even after applying corrections for transactions costs and risk (HuiYeh, 2012). Additionally it was found that if technical and fundamental analysis point towards the same direction; then technical trading strategies would be gainful. Gomez et. al. (2010) tested four technical trading rules for the Mexican Stock Market for a period of 20 years and found moving average rules had the ability to predict the trends hence resulting in profitable trading. Likewise, Sulistianwan et. al. (2014) applied technical indicators to the Indonesian stock market to test whether it gave signals before and after earning announcement date. They found technical indicators were able to realize signals before earning announcements but was incapable to give similar results after earning announcements. Metghalchi et. al (2007) examined the Greek stock market for the period 1990 to 2006. It was found that technical trading rule did help to predict the trend and may possibly determine recurring price patterns. Moreover they claimed that technical analysis could outperform the buy and hold strategy. Oberlechner (2001) conducted a survey to identify the significance of applying fundamental or technical analysis by exchange traders or journalists in the European market. The results revealed that most of the traders and financial journalists applied both the techniques in order to forecast. On the other hand it was found that financial journalist emphasised more towards fundamentalism compared to foreign exchange traders.

RESEARCH METHODOLOGY

Data Collection

The research is based on secondary data which is collected from the Muscat Securities Market website. Various journal articles, research papers, books and reports were referred to carry out this research.

Period of Study

The period of study commences from 1st June 2001 until 31st May 2011 i.e. a period of 10 years averaged on daily & monthly basis.

Population

Muscat Securities Market comprises a total of 121 companies which are spread over 3 different sectors namely finance, industry and service.

Sample Study

The principal Index i.e. MSM-30 Index which is a representation of the 30 companies listed on the Muscat Securities Market.

Technical Tools Applied in the Study

Charts and Graphs

The graphical representation helps to determine the current trend in buying and selling and gives an indication on

the future trend to be followed.

- Dow Theory
- Support Resistance Level/ Trade Range Break Out
- Moving Average Convergence & Divergence - MACD

Statistical tools

These tools indeed help to identify the past trends and hence illustrate the characteristics of the market.

- Relative Strength Index
- Runs Test

ANALYSIS & FINDINGS

Trends in Muscat Securities Market

The MSM - 30 Index seems to have bullish trend starting from June 2001 to September 2007 signifying a strong potential for investments. However, MSM-30 Index was not an exception for global financial crisis which occurred between June 2008 to May 2009 during which the market witnessed bearish trend which can be studied under three phases. The first phase included heavy buying by investors who are well aware with the expectation of a long term growth and feel that chances of the market to face a downturn are less. The second phase is a result of growth in the companies earning and further growth in the economic indicators compared to the past, investors still invest during this period with the anticipation of further growth. Lastly the third phase where the earnings and the economic conditions are at its peak, the normal public develops the confidence of investing in stocks referring to the past growth rates and hence participate whereas the investors who have purchased during the first phase start liquidating their stocks with the fear of a downturn. These three phases of a primary trend can clearly be noticed in figure1. It was during this period the MSM- 30 Index witnessed an abnormal growth rate and reached its peak within a very short span of time from around 6500 points to 12000 points. Seeing that the growth rate was abnormal it was likely for the index to fall at the same rate as the growth. Due to the sub-prime lending which affected the most of the companies around the world going bankrupt; this had an adverse effect on Muscat Securities Market. The market started to reverse and the market became bearish. Lastly the third phase which is formed due to heavy selling in the previous phase lead to the selling of the share even below its intrinsic value. In this phase it is observed that the support level in the previous year's become the current resistance level for the index. Minor trends are the daily fluctuations in the price mainly caused due to the demand and supply in the market. There is countless number of these minor trends which can be noticed in the figure1 which will not affect the movement of market in long run.

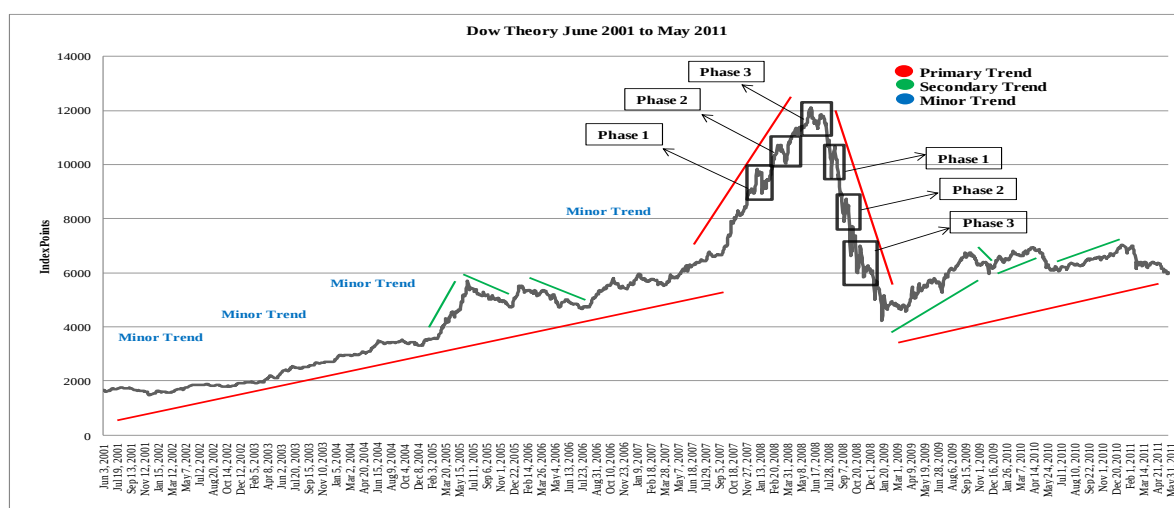

Figure 1: Showing the Results from the Application of Dow Theory on MSM-30 Index from June 2001 to May 2011

Results of Trading Range Breakout

The support and resistance level for MSM-30 Index is explained by dividing the 10 years period into 4 segments as shown in figure 2. In the first segment i.e. the period from 2001 to 2004 the support level is maintained at around 2000 points whereas the resistance was at 4000 points. In the 2nd segment it is seen that the resistance level in the 1st segment becomes the support level for the 2nd segment; this happens mainly because the bulls or the buyers who didn't invest when the points were at 4000 start investing heavily with an anticipation of the market reaching higher highs than before therefore pushing the points further to a next level. In the 3rd segment with the expectations of the investors raising the same trend was observed with the resistance level in 2nd segment becoming the support level for the 3rd segment. In this segment a breakout is observed in the month of September 2007 where the expectations increase along with the prices hence the index having a quicker growth rate and creates a buying pressure. After reaching to a certain level and creating highest possible highs for the index the market starts to fall or face a bearish trend hence creating a selling pressure on the market; this point is known as traders remorse where the expectations of the investors have changed therefore the prices tend to get corrected automatically and are brought down to their intrinsic value. The main reason for the expectations of investors at the Muscat Securities Market to have changed was because of the global financial crisis, most of the companies were reporting lower earnings as compared to the previous years. In the 4th segment after the prices have been corrected the support level comes back to the same point as it was in the 2nd segment. Hence it can be said that trade range breakout as a technical indicator with reference to MSM-30 Index successfully correlates with the market results.

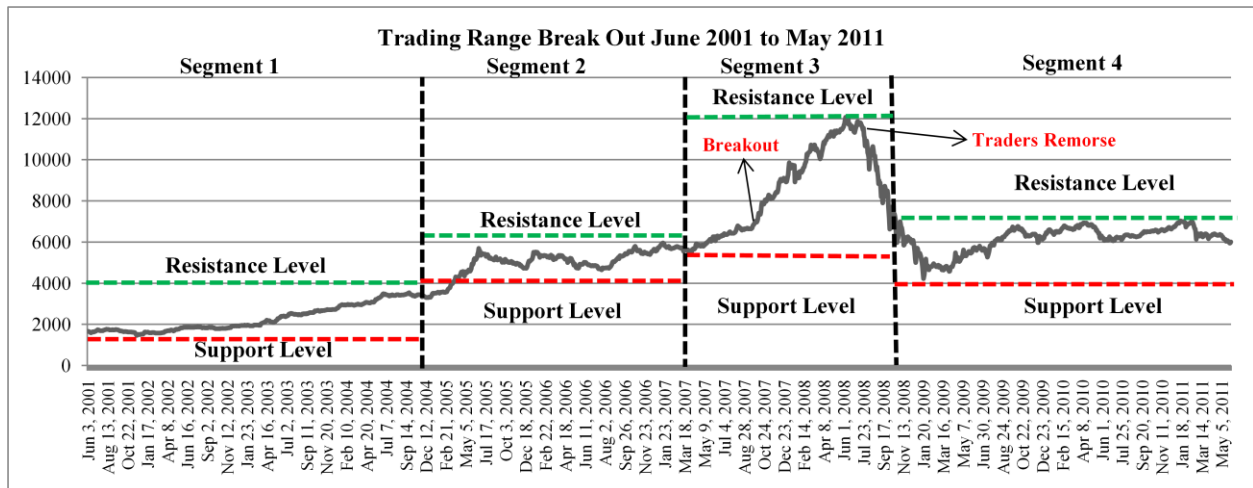

Figure 2: Showing the Trading Range Break Out on MSM-30 Index from June 2001 to May 2011

Moving Average Convergence & Divergence - MACD

The MACD as a technical indicator affirm that there is a convergence when moving averages move towards each other whereas there is a divergence when moving averages move away from each other. Positive MACD indicate that 12 Day EMA has crossed the 26 Day EMA. This increases as the shorter EMA diverges further below the longer EMA. From the figure 3 it can be noticed that the MACD line (blue line) cuts the signal line (red line) from above on January 20th 2002 at which the MSM-30 index value was 1622 points indicating a sell signal and further it can be noticed from table 1 that the index value has gone down continuously and reached to the lowest point i.e. 1571. It is exactly during this period when the MACD line cuts the signal line from below on March 5th, 2002 indicating a buy signal. It can be clearly seen from the figure 3 that the MSM-30 Index value starts increasing from that date. Similarly many points were identified and tested for buy and sell signals which proved to be effective with reference Muscat Securities Market. Hence it can be said that moving average convergence and divergence as a technical tool provides a strong signal which can be enchased by the prospective investors.

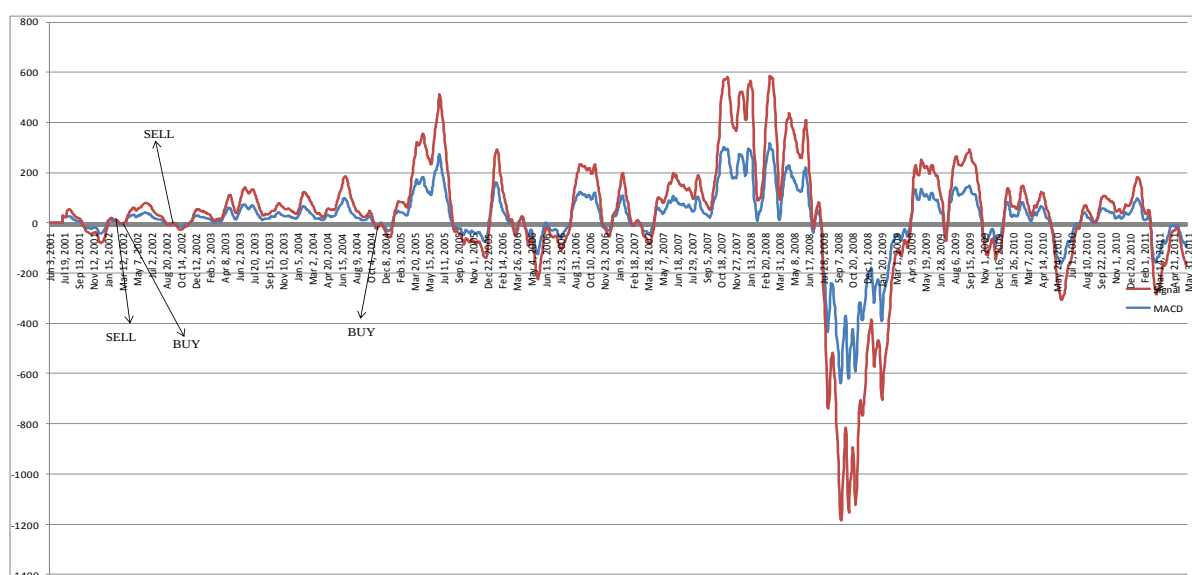

Figure 3: Showing the MACD on MSM-30 Index from June 2001 to May 2011

Relative Strength Index

The rule followed in this indicator is, if the RSI is at or above 70 there are more chances for the index or share to fall which gives an indication to sell. Likewise if the RSI is at or below 30 it gives an indication that the index or share will be rising in the near future therefore it's time to buy. The results of the RSI as a technical indicator in MSM-30 Index shows History tends to repeat. Analysing the graphs generated using RSI as shown in figure 4 it was found that the index is following the same trend every year. For instance the RSI in the month of January for the past 10 years has always been above 70 therefore indicating a sell signal. Soon after the month of January it is examined that the market turns out to be bearish with the RSI falling immensely which is also reflected in the rule of RSI that after the RSI reaches 70 there are chances for the market to fall or take a downward trend. The main reason for the market to become bearish or be in downward trend during this period would be because this is the time where most of the companies publish their annual reports for the preceding year. It is observed that for the months of March throughout the study the RSI gives buy signal since heavy selling in the previous month creates more supply in the market therefore the index points going down. The other reason for the RSI indicating buy signal during this period could be because of the dividend season being near and therefore investors could earn higher profits by buying at this time.

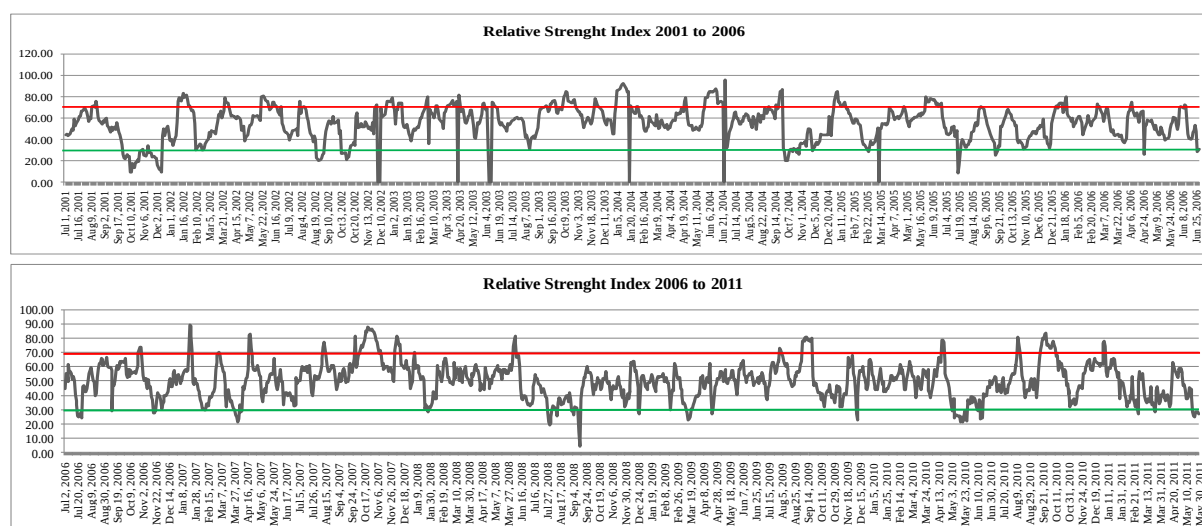

Figure 4: Showing the Results from RSI on MSM-30 Index from June 2001 to May 2011

Runs Test

The runs test is a method for determining whether the index values are behaving in random fashion. However when test runs was conducted with MSM - 30 Index, it reported only 26 runs for a period of 10 years taken on daily basis. the details of which can be seen in table 2 with a standard deviation of 23.195 a low P value of 0.000, from which we can conclude that the clear trend could not be observed because of reasons such as MSM is a controlled market with a provision of plus or minus 10% of increase or decrease in share price. This in turn means that a limit defined for the volatility of the share for which standard deviation of the above said data seems to be high because of which a clear trend could not be observed. It can be finally said that there is no specific pattern followed by MSM-30 Index as far as the period of study is concerned.

CONCLUSIONS

In this research results were obtained after analyzing the data for the past 10 years hence being effective in determining the past trends and predicting the future which moreover supported the assumptions on technical analysis. Technical indicators used in this study provide excellent results so as to determine the past trend of the market and the buying and selling trends followed by the investors. It is also found that the bubble burst caused due to the global financial crisis resulted in traders' remorse where the investors lost confidence in the market and hence regretted investing. The support and resistance for the past 10 years help to come to a conclusion as to what would be the minimum and maximum point the index can reach. This minimum and maximum point is helpful in developing a strategy as at what point an investment has to be made and when should an investor refrain from investing. Overall MACD as a technical indicator clearly reveals buy and sell points much in advance with reference to MSM-30 Index movement. In addition to this the index value behaved according to the signal traced out as per MACD. This is in line with (Hui Yeh, 2012) that one of the best technical indicator is MACD. The application of statistical technical tools had similar results as by using graphs and charts except for runs test. Moreover this study helps to realize the overall trend followed by the index and hence provide a valuable informational support to investors who wish to invest at Muscat Securities Market.
