#### Abstract

The main objective of this paper is to introduce another type of fully cancellation (denoted it F-Cancellation) module, namely prime -Fully Cancellation (denoted as PFC-Module), and we study the relationships btween these two concepts. We investigate some results of such modules.

KEYWORDS: Fully Cancellation Module, Max-Fully Cancellation Module, Artinian Ring, Boolean Ring and PFC-Module

## 1. INTRODUCTION

Throughout this paper, all rings are commutative with identity and all modules are unitary. Let M be an R -module. Then, M is said to be fully cancellation module,. f for each ideal I of R and for each submodules $N_{1}, N_{2}$ of $M$ such that, $I N_{1}=I N_{2}$ implies $N_{1}=N_{2}$ [1]. In this case, if for every non-zero maximal ideal $I$ of $R$ and for every submodules $\mathrm{N}_{1}$ and $\mathrm{N}_{2}$ of M such that $\mathrm{IN}_{1}=I \mathrm{~N}_{2}$, then $\mathrm{N}_{1}=\mathrm{N}_{2}$ and we call it maximal -fully cancellation module (denoted it by the symbol MFC-Modul [2]. Now in this paper, we define the concept of prime -Fully cancellation (denote it by the symbol PFC-Module), we give some equivalent conditions for a PFC-Modul.

Also, we will find some relations between max-fully cancellation module and PFC-Module.

## 2. MAIN RESULTS

## Definition (2.1)

Let M be a R-module. M is called PFC-Module for every non zero prime ideal I of R and for every submodules $\mathrm{N}_{1}, \mathrm{~N}_{2}$ of M such that $\mathrm{I} \mathrm{N}_{1}=I \mathrm{~N}_{2}$, then $\mathrm{N}_{1}=\mathrm{N}_{2}$.

Remarks and Examples (2.2)
(1) Z as the Z - module is a PFC - Module.
(2) $\mathrm{Z}_{6}$ as a $\mathrm{Z}_{6}$-module is not PFC-Module.Since $\left(\overline{3)}\right.$ is prime ideal of $\mathrm{Z}_{6}$ and $\overline{(3)}, \mathrm{Z}_{6}$ are submodules of $\mathrm{Z}_{6}$ such that $\overline{(3)}(\overline{3})=(\overline{3}) \mathrm{Z}_{6} \mathrm{Z}$ s not prime-fully motion by the symbol MFC-Modul but $(\overline{3}) \neq \mathrm{Z}_{6}$.
(3) Every full cancellation module is a PFC - Module, but the converse is not true in general for example:-

Let $\mathrm{R}=\mathrm{Z}_{24}$ and $\mathrm{M}=\left(\overline{3)}\right.$ as an R-module ,since $\left(\overline{2)}\right.$ is prime ideal of $\mathrm{Z}_{24}$ and $(\overline{9)},(\overline{21)}$ are two submodules of $(\overline{3)}$ Such that $(\overline{2)}(\overline{9})=(\overline{2)}(\overline{21)}=(\overline{18)}$.Then $(\overline{9)}=(\overline{21)}$. Whil it is not fully cancellation R-module. Since $(\overline{8)}$ is a nonzero ideal of $\mathrm{Z}_{24}$ and $(\overline{3)},(\overline{0})$ are two submodules of $(\overline{3)}$ Such that $(\overline{8})(\overline{3)}=(\overline{8})(\overline{0})=(\overline{0})$,but $(\overline{3}) \neq(\overline{0})$.
(4) Every submodule of a PFC-Module is a PFC - Module.
(5) Let $M_{1}$ and $M_{2}$ be an R-modules such that $M_{1}\left(M_{2}\right.$. Then $M_{1}$ is a PFC - module if and only if $M_{2}$ is

PFC-Module.
The Following Theorem is a Characterization of PFC-Module:

## Theorem (2.3)

Let M be an R-module, let $\mathrm{N}_{1}, \mathrm{~N}_{2}$ are two submodules of M , let I be a non zero prime ideal of R , then the following statements are equivalent:-
(1) M is an MFC - Module.
(2) if $\mathrm{IN}_{1} \subseteq \mathrm{IN}_{2}$, then $\mathrm{N}_{1} \subseteq \mathrm{~N}_{2}$.
3) if $\mathrm{I} \prec \mathrm{a} \succ \subseteq \mathrm{IN}_{2}$, then $\mathrm{a} \in \mathrm{N}_{2}$ where $\mathrm{a} \in \mathrm{M}$.
(4) $\left(\mathrm{IN}_{1}: \mathrm{R} \mathrm{IN}_{2}\right)=\left(\mathrm{N}_{1}:_{\mathrm{R}} \mathrm{N}_{2}\right)$

## Proof

1) $\Rightarrow$ (2) If $\mathrm{IN}_{1} \subseteq \mathrm{IN}_{2}$ then $\mathrm{IN}_{2}=\mathrm{IN}_{1}+\mathrm{IN}_{2}$ Which Implies $\mathrm{IN}_{2}=\mathrm{I}\left(\mathrm{N}_{1}+\mathrm{N}_{2}\right)$,

But M is PFC-Module, then $\mathrm{N}_{2}=\left(\mathrm{N}_{1}+\mathrm{N}_{2}\right)$ and hence $\mathrm{N}_{1} \subseteq \mathrm{~N}_{2}$
If $\mathrm{I}<\mathrm{a} \succ \subseteq \mathrm{IN}_{2}$ then $\left.\prec \mathrm{a}\right\rangle \subseteq \mathrm{N}_{2}$ by (2) Which implies, $\mathrm{a} \in \mathrm{N}_{2}$. (2) $\Rightarrow$ (3)
(3) $\Rightarrow$ (4) If $\mathrm{IN}_{1}=\mathrm{IN}_{2}$, To prove that $\mathrm{N}_{1}=\mathrm{N}_{2}$. Let $\mathrm{a} \in \mathrm{N}_{1}$ then $\mathrm{I}\left\langle\mathrm{a} \succ \subseteq \mathrm{IN} 1 \subseteq \mathrm{IN}_{2}\right.$ And hence $\mathrm{a} \in \mathrm{N}_{2}$ by (3) Similarly , we can show $\mathrm{N} 2 \subseteq \mathrm{~N}_{1}$. Thus $\mathrm{N}_{1}=\mathrm{N}_{2}$.
(1) $\Rightarrow$ (4) Let $r \in\left(\mathrm{IN}_{1}: R \mathrm{IN}_{2}\right)$, Then $r \mathrm{IN}_{2} \subseteq \mathrm{IN}_{1}$ So, $\operatorname{IrN}_{2} \subseteq \mathrm{IN}_{1}$ and since (1) implies (2), we have $\mathrm{N}_{2} \subseteq \mathrm{~N}_{1}$.

Thus $r \in\left(\mathrm{~N}_{1}: \_\mathrm{RN}_{2}\right)$ and hence $\left(\mathrm{IN}_{1}: \mathrm{R}_{2}\right) \subseteq\left(\mathrm{N}_{1}: \mathrm{RN}_{2}\right)$
Let $\mathrm{r} \in\left(\mathrm{N}_{1}:{ }_{\mathrm{R}} \mathrm{N}_{2}\right)$. Then $\mathrm{rN}_{2} \subseteq \mathrm{~N}_{1}$ which implies $\operatorname{IrN}_{2} \subseteq \mathrm{IN}_{1}$ and hence $\mathrm{rIN} \mathrm{N}_{2} \subseteq \mathrm{IN}_{1}$.
Therefore $\left.\mathrm{r} \in\left(\mathrm{IN}_{1}: \operatorname{RIN}\right)_{2}\right)$ and hence $(\mathrm{N} 1: \mathrm{RN} 2) \subseteq\left(\mathrm{IN}_{1}: \mathrm{RIN}_{2}\right)$. Then we get $\left(\mathrm{N}_{1}: \mathrm{RN}_{2}\right)=\left(\mathrm{IN}_{1}: \operatorname{RIN}_{2}\right)$
$(4) \Rightarrow(1)$
Let $\mathrm{IN}_{1}=\mathrm{IN}_{2}$ Then by (4) $\left(\mathrm{IN}_{1}: \mathrm{R} \mathrm{IN}_{2}\right)=\left(\mathrm{N}_{1}: \mathrm{RN}_{2}\right)$. But $\left(\mathrm{IN}_{1}:\right.$ R $\left.\mathrm{IN}_{2}\right)=\mathrm{R}$
(Since $\left.\mathrm{IN}_{1}=\mathrm{IN}_{2}\right)$. Then $\left(\mathrm{N}_{1}: R \mathrm{~N}_{2}\right)=\mathrm{R}$ so $\mathrm{N}_{2} \subseteq \mathrm{~N}_{1}$. Similarly $\left(\mathrm{IN}_{2}:\right.$ R $\left.\mathrm{IN}_{1}\right)=\left(\mathrm{N}_{2}: \mathrm{RN}_{1}\right)$
Thus $\left(\mathrm{N}_{2}: R \mathrm{~N}_{1}\right)=\mathrm{R}$ Which implies $\mathrm{N} 1 \subseteq \mathrm{~N}_{2}$. Therefore $\mathrm{N}_{1}=\mathrm{N}_{2}$. .
Before we give our proposition, the following concepts are needed.
A ring R is called a Boolean ring, in case, each of its elements is an idempotent. And, a commutative ring R with unity is called an Artinian ring, if and only if for any descending chain of ideals $\mathrm{I} 1 \supseteq \mathrm{I} 2 \supseteq \mathrm{I} 3 \supseteq$. $\qquad$ of $\mathrm{R} \exists \mathrm{n} \in \mathrm{Z}+$ such that $\mathrm{In}=\mathrm{In}+1=$ $\qquad$ [3]

Now, the following proposition gives the relationship betweenMFC-Module and PFC-Module.

## Proposition (2.4)

Every PFC-Module is max-fully cancellation module

## Proof

It is easy
The converse of proposition (2.4) is true under the condition that the ring R is PID or regular or Artinian or Boolean ring.

## Proposition (2.5)

Let R be a PID (regular or Artinian or Boolean) and $M$ be an R-module.
Then, is PFC-Module if and only if M is MFC-Module.

## Proof

It is obvious

## Proposition (2.6)

Let M be a MFC-Module over a ring. If M is a cancellation module, then every non zero maximal ideal of R is cancellation ideal.

## Proof

Let I be a nonzero maximal ideal of R , such that $\mathrm{AI}=\mathrm{BI}$, where A , B is two ideals of R . Now, we have $\mathrm{AIM}=\mathrm{BIM}$, then IAM=IBM. But M is an MFC - Module,

Therefore, $\mathrm{AM}=\mathrm{BM}$. As M is cancellation module, then $\mathrm{A}=\mathrm{B}$ by [4].

## Proposition (2.7)

Let $\mathrm{M}, \mathrm{N}$ be two R-modules. If $\mathrm{M} \cong \mathrm{N}$, then M is PFC-Module if and only if N is a PFC - Module.

## Proof

Let $\theta: M \rightarrow N$ be an isomorphism. Suppose $M$ is a MFC-Module
To prove N is a MFC-Module,
For every non zero prime ideal I of R and every submodules $\mathrm{N}_{1}, \mathrm{~N}_{2}$ of N.Let $\mathrm{I} \overline{\mathrm{N}_{1}}=\mathrm{I} \overline{\mathrm{N}_{2}}$
Now, there exists two submodules $\mathrm{N}_{1}, \mathrm{~N}_{2}$ of M such that $\theta(\mathrm{N} 1)=\overline{\mathrm{N}_{1}}, \theta\left(\mathrm{~N}_{2}\right)=\overline{\mathrm{N}_{2}}$
Then $\mathrm{I} \theta\left(\mathrm{N}_{1}\right)=\mathrm{I} \theta\left(\mathrm{N}_{2}\right)$,, Which implies $\theta\left(\mathrm{I} \mathrm{N}_{1}\right)=\theta\left(\mathrm{I} \mathrm{N}_{2}\right)$. Therefore $\mathrm{IN}^{1}=\mathrm{IN}_{2}$
since $\theta$ is (1-1))But M is PFC-Module. Then $N_{1}=N_{2}$ and hence
$\theta\left(\mathbf{N}_{1}\right)=\theta\left(\mathrm{N}_{2}\right)$ Therefore $\overline{\mathrm{N}_{1}}=\overline{\mathrm{N}_{2}}$ That is N is PFC-Module.

## Conversely

Suppose that N is PFC-Module over the a ring. Let $\mathrm{IN}_{1}=\mathrm{IN}_{2}$ for every non Zero prime ideal I of R and every submodules $\mathrm{N}_{1}, \mathrm{~N}_{2}$ of M. Now, $\theta\left(\mathrm{I} \mathrm{N}_{1}\right)=\theta\left(\mathrm{I} \mathrm{N}_{2}\right)$. Which implies I $\theta\left(\mathrm{N}_{1}\right)=\mathrm{I} \theta\left(\mathrm{N}_{2}\right)$, where $\theta\left(\mathrm{N}_{1}\right), \theta\left(\mathrm{N}_{2}\right)$ are two submodules of N

Also N is a PFC - Module. Then $\theta\left(\mathrm{N}_{1}\right)=\theta\left(\mathrm{N}_{2}\right)$ Which implies $\mathrm{N}_{1}=\mathrm{N}_{2}$
since $\theta$ is (1-1)) Which completes the proof.

## CONCLUSIONS

This study was conducted to introduce a different type of fully cancellation module, denoted as F-Cancellation, namely, prime-Fully Cancellation (denoted as PFC-Module). The relationship between the two concepts were investigated on these modules, and the results have been presnetd in this paper.
